

Cyo-Control

*Probiotic bacteria to displace
cyanobacteria biofilms*

Contains probiotic bacteria on a zeolite substrate. **Tropic Marin® Cyo-Control** serves to permanently displace cyanobacteria by inhibiting the recolonization with cyanobacteria after their removal.

CONTROL

Cyo-Control

*Probiotic bacteria to
displace cyanobacteria
biofilms*

Tropic Marin® Cyo-Control naturally blocks the recurrence of cyanobacteria in the aquarium. After the cyanobacteria have been removed manually, the probiotic bacteria of **Tropic Marin® Cyo-Control** settle in their place. Once these bacteria have established themselves, they outcompete the cyanobacteria, preventing them from recolonizing the area. The zeolite substrate supports the probiotic bacteria in this process and makes the water extremely clear after a short period of cloudiness.

Advantage:

- Reliable cyanobacteria prevention after manual removal.
- Purely natural, based on probiotic bacteria and natural zeolite mineral.
- Only a few doses required.
- Binds pollutants and makes the water extremely clear.
- Can be stored without refrigeration.
- No antibiotics, no biocides, no toxins

Application and dosage:

Siphon off as much of the cyanobacteria as possible before the first application. Dose 50 ml per 100 l (26 US-gal.) water volume and turn off skimmer and UV-C devices for about 2 hours. Repeat the dosing on the 3rd and 5th day after the first application and siphon off any cyanobacteria deposits again beforehand. After a short period of cloudiness, the aquarium water becomes extremely clear.
